

**Appln No. 10/618,033**  
**Amdt date November 9, 2006**  
**Reply to Office action of August 9, 2006**

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

Please amend claims 1, 5, 8-12, 14 and 18.

1. (Currently Amended) A device comprising:  
an elongated tubular body having an axis, a proximal end, a distal end and a lumen longitudinally extending therethrough; and  
a dilating tip slidably mounted on the distal end of the tubular body and comprising a segmented surface that is generally transverse to the axis of the tubular body, and a generally rigid tube extending distally from the segmented surface and having a sharp distal end adapted to puncture tissue;  
wherein distal movement of the tubular body relative to the dilating tip exerts a force on the segmented surface to thereby open the segmented surface.
2. (Original) A device according to claim 1, wherein the elongated tube is generally cylindrical.
3. (Original) A device according to claim 1, where the segmented surface comprises two or more segments.
4. (Original) A device according to claim 1, where the segmented surface comprises three or more segments.
5. (Currently Amended) A device according to claim 1, wherein the dilating tip further comprises a ring mounted in surrounding relating relation to the tubular body.

**Appln No. 10/618,033**  
**Amdt date November 9, 2006**  
**Reply to Office action of August 9, 2006**

6. (Original) A device according to claim 5, wherein the segmented surface comprises a plurality of segments, each of which is hingedly attached to the ring.

7. (Original) A device according to claim 1, wherein the dilating tip is generally funnel-shaped.

8. (Currently Amended) A device according to claim 1, wherein the generally rigid tube of the dilating tip is segmented.

9. (Currently Amended) A device according to claim 1, wherein the generally rigid tube of the dilating tip has a length ranging from about 2 mm to about 6 mm.

10. (Currently Amended) A device according to claim 1, wherein the generally rigid tube of the dilating tip has a length ranging from about 3 mm to about 5 mm.

11. (Currently Amended) A device according to claim 1, wherein the generally rigid tube of the dilating tip has an outer diameter ranging from about 0.6 mm to about 1 mm.

12. (Currently Amended) A device according to claim 1, wherein the generally rigid tube of the dilating tip has an outer diameter ranging from about 0.7 mm to about 0.8 mm.

13. (Original) A device according to claim 1, wherein the dilating tip comprises nitinol.

14. (Currently Amended) A device according to claim 1, further comprising a wire extending proximally from the dilating tip to near the proximal end of the tubular body to affect effect proximal movement of the dilating tip relative to the tubular body.

**Appln No. 10/618,033**  
**Amdt date November 9, 2006**  
**Reply to Office action of August 9, 2006**

15. (Original) A device according to claim 14, further comprising a slidable member on the proximal end of the tubular body, the slidable member being connected to the wire so that proximal movement of the slidable member pulls the wire and causes proximal movement of the dilating tip relative to the tubular body.

16. (Original) A device according to claim 15, further comprising a latch for maintaining the position of the slidable member relative to the tubular body when the dilating tip is in an open arrangement.

17. (Original) A device according to claim 1, further comprising a pressure valve at or near the proximal end of the tubular body.

18. (Currently Amended) A device comprising:  
an elongated tubular body having an axis, a proximal end, a distal end and a lumen longitudinally extending therethrough;  
a dilating tip slidably mounted on the distal end of the tubular body and comprising:  
a ring mounted in surrounding relation to the distal end of the tubular body;  
a segmented surface that is generally transverse to the axis of the tubular body, the segmented surface comprising three or more segments, each segment being hingedly attached to the ring; and  
a generally rigid tube extending distally from the segmented surface, the tube having a sharp distal end adapted to puncture tissue and being segmented into three or more segments; wherein distal movement of the tubular body relative to the dilating tip exerts a force on the segmented surface and the generally rigid tube to thereby open the segmented surface and the generally rigid tube.

19. (Original) A device according to claim 18, further comprising:

**Appln No. 10/618,033**

**Amdt date November 9, 2006**

**Reply to Office action of August 9, 2006**

a slidable member slidably mounted on or near the proximal end of the tubular body; and  
a wire having a distal end attached to the ring of the dilating tip and a proximal end  
attached to the slidable member;  
wherein proximal movement of the slidable member pulls the wire and causes proximal  
movement of the dilating tip relative to the tubular body.

20. (Withdrawn) A method for accessing the left atrium of a patient comprising:  
inserting the dilating tip of the device of claim 1 into the right atrium of the  
patient;  
puncturing the atrial septum with the tube of the dilating tip to create a trans-  
septal hole;  
advancing the tubular body distally relative to the dilating tip to open the  
segmented surface and introduce a distal portion of the tubular body into the left atrium through  
the trans-septal hole.

21. (Withdrawn) A method according to claim 20, further comprising advancing at  
least a portion of the dilating tip through the trans-septal hole prior to advancing the tubular body  
distally relative to the dilating tip.

22. (Withdrawn) The method of claim 20, further comprising monitoring the pressure  
in the tubular body.
